Spinal Cord Rehabilitation

Responsive: Our patients are welcomed into our hospital care as soon as possible after their injury or illness.

■ Regional average days until care
■ AHC Rehab average days until care

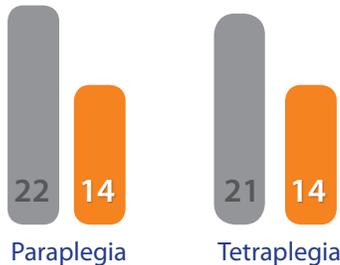

Balanced: We understand the complexities that both men and women face in their rehabilitation.

Effective: Our patients achieve their goals in a shorter length of time so they can return home faster.

■ Regional average days of stay
■ AHC Rehab average days of stay

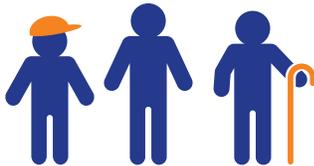

Results-oriented: In order to ensure the best outcomes, we measure how much each patient has improved each day. Our patients' daily improvement is among the highest in the region.

44% higher daily improvement than the average regional patient

Personalized: We treated patients ranging from 24 to 93 years of age in our spinal cord program, with the average being 68 years of age.

Compassionate: Our patients consistently report positive satisfaction ratings about our hospital and care to an independent auditor.

Customized: Our patients receive intensive rehabilitation therapy. Our spinal cord program patients on average participated in 15.7 hours of therapy a week.

Successful: More than 76 percent of our patients returned to their home after leaving our hospital.

Some patients' needs were best met by other support, including care in an acute-care hospital or in a skilled nursing facility.
